

Exercise 1 — Spot the Bias!

Class Discussion • 10 minutes

Your Mission

Read each scenario carefully. For every one, fill in the analysis table below it. Think about:

- Which group of people might be treated unfairly by this AI?
- What real-world harm could this bias cause?
- How would you make the training data fairer?

Scenario A

A

Music Recommendation AI

An AI was trained only on songs popular with 18–25 year olds in one country. It now recommends music for all users on a global streaming platform.

Who might be left out?	What could go wrong?	How would you fix it?

Scenario B

B

Hiring AI

A company built an AI to shortlist job applicants. It was trained on 10 years of resumes from a company where 90% of employees hired were male.

Who might be left out?	What could go wrong?	How would you fix it?

Scenario C

C

Disease Detection AI

A hospital system deployed an AI to flag patients at high risk of a certain disease. The AI was trained on patient records from one wealthy urban neighborhood.

Who might be left out?	What could go wrong?	How would you fix it?

Reflection

After discussing all three scenarios, answer: What is the most important step a data scientist can take to prevent bias before training begins?

Your answer:
