

Exercise 3 — Build Your Own Dataset

Group Activity • 15 minutes • Group members: _____

Step 1 — Choose Your AI Goal

Tick the box next to the goal your group will work on. If you choose ★, describe your idea in the row.

☐ A	An AI that predicts whether a student will enjoy a new school subject.
☐ B	An AI that recommends a weekend activity based on a person's profile.
☐ C	An AI that detects whether a short text message is friendly or unfriendly.
☐ ★	Your own idea! Describe below:

Step 2 — Design Your Features

What information (features) would help your AI make a good prediction? Think about what data you'd need to collect about each person.

- List 4–5 features. Be specific — "age" is better than "info about the person".
- Choose a label — what is the AI trying to predict? (e.g., Yes/No, a number, a category)

Step 3 — Fill In Your Dataset

Write your feature names in the blue header row. Then invent 5 realistic (made-up) people and fill in the rows. Make sure the labels match the patterns you chose.

#	Feature 1	Feature 2	Feature 3	Feature 4	Label (Answer)
<i>Write your feature names below ↓</i>					
Row 1					
Row 2					
Row 3					
Row 4					
Row 5					

Step 4 — Spot Your Own Bias

Describe one way your dataset might be biased or incomplete. Which group of real people might your AI treat unfairly?

Write your answer here...

How could you change your dataset to make it fairer?

Write your answer here...

Presenting to the Class

Be ready to share: (1) your AI's goal, (2) the features you chose, (3) one example row from your dataset, and (4) the bias you found. You have 2 minutes.
